

Wild, connected, and diverse:

Appalachian Trail as conservation corridor?

Travis Belote and Pete McKinley

**The
Wilderness
Society**

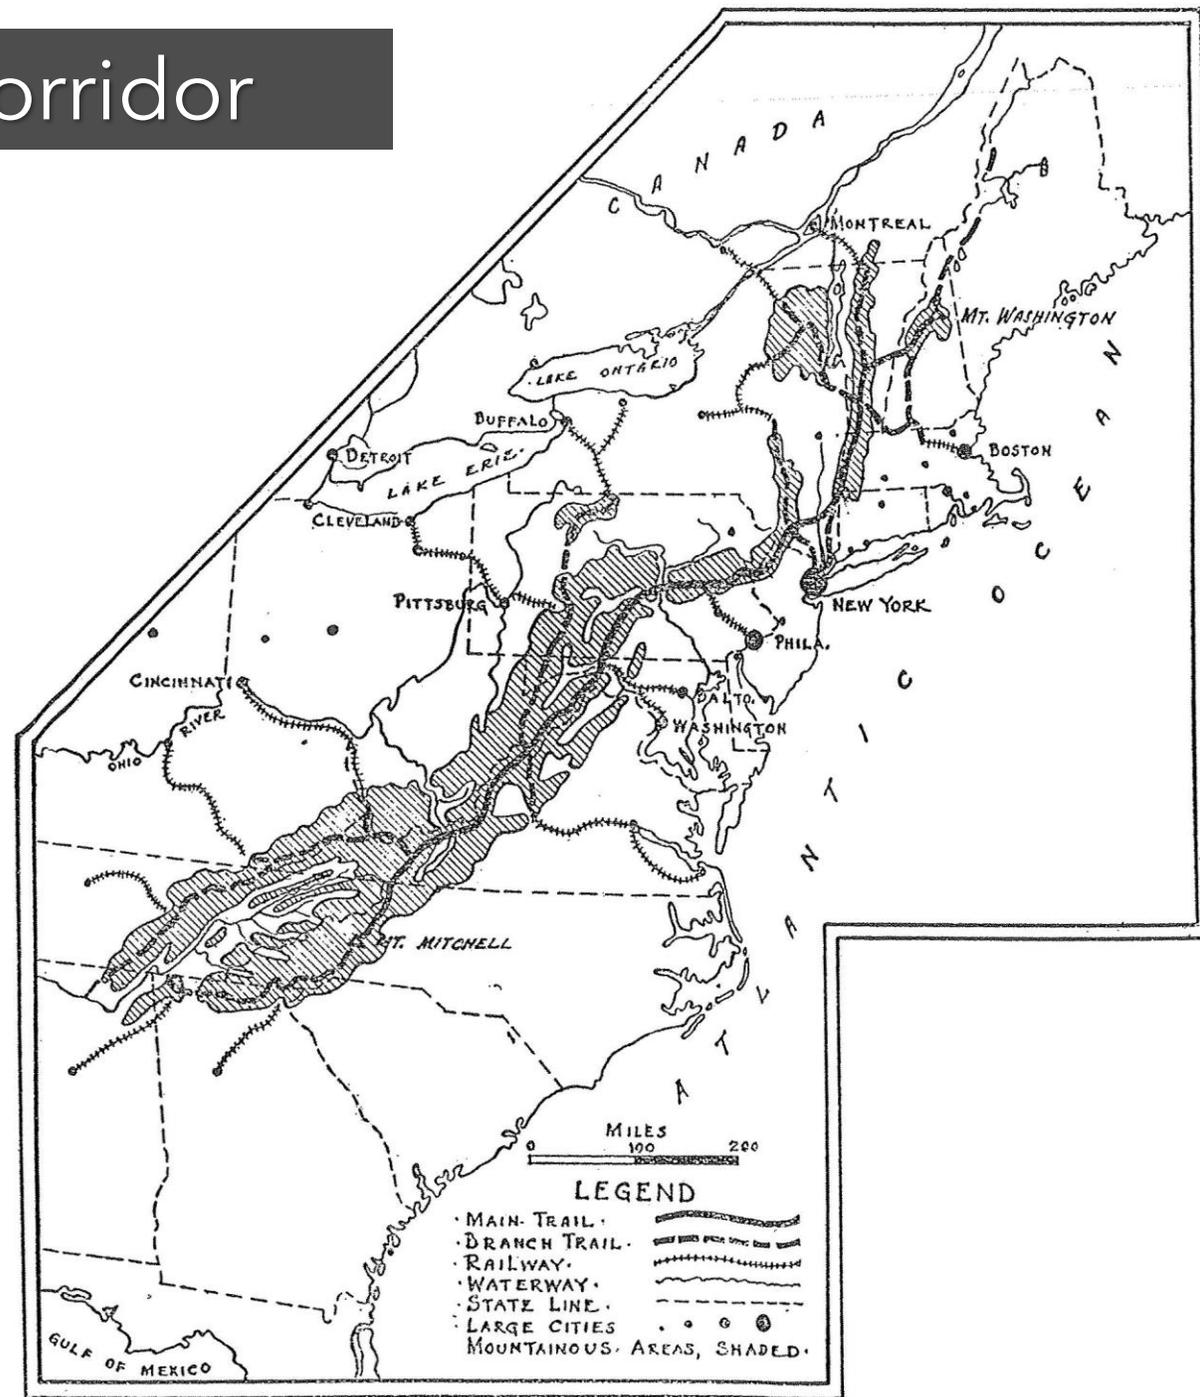

Just cut to the chase...

1. Aspirational and regional visions for conservation can motivate action (e.g., Y2Y).
2. The Appalachian Mountains are a critical region for connectivity and biodiversity, especially in the face of climate change.
3. Data can help identify the most important sections of the AT and put conservation into a broader context.
4. The Appalachian Trail can serve as the "flagship" of a Y2Y-like model, but conservation of biodiversity requires coordination across the broader region.

Abstract
 The Appalachian Trail (AT) traverses the Appalachian Mountains across 11 degrees of latitude from Springer Mountain in Georgia to Maine's Mt. Katahdin. The 3,524 km (2,190-mile) long trail is buffered within a conserved corridor that is at least ~305 m wide and covers approximately 101,000 hectares (250,000 acres) overseen by the National Park Service (NPS), making it one of the largest NPS units in the East. Although a continuous marked trail has been established since 1937, protection of the corridor was not complete until the last couple of decades. Additional conservation designations exist adjacent to much of the trail corridor.

Select By Attribute

Multiple criteria to select (i.e., identify) places that are high value but not well protected

The screenshot displays the ArcMap interface with a map of the Appalachian region. A data table is open, showing the following columns: GAP4, AT_segme_1, elevation, and integ. The table contains 48 rows of data. A 'Select By Attributes' dialog box is open, showing the layer 'at_data_new' and the method 'Create a new selection'. The selection criteria are: "RWR" > 100 AND "GAP12" < 20. The dialog box also shows a list of fields: "FID", "AT_segment", "Field1", "Atmile", and "GAP12".

"Most natural linkage"

Combining ecological with social considerations

A scenic landscape at sunset. The sky is filled with large, dark clouds illuminated from below by a bright orange and yellow sun, creating a dramatic, colorful sky. In the foreground, there are lush green bushes with numerous bright pink flowers. The background shows rolling green hills and mountains under a hazy, blue sky.

Thank you!
